[RED] Weekly observability report, 2026-11-04

New Relic Workflow Automation <noreply@eu-notifications.newrelic.com> Wed, Nov 4, 2026 at 11:48 PM
To: [redacted]

new relic

Hello,

Weekly observability report

Generated 2026-11-04 23:45 UTC. Overall: RED

1. Health summary

Area	Status	This week	Week over week	Source
Alert events	RED	146 critical open now, 23 warning open now	critical opened 3960 (prev 3642), warning opened 1559 (prev 2018)	[1], [2], [3], [4]
APM services	RED	2 of 19 services above 1% errors Top errors: netdemo-front-apm 5.68% (46717 requests) Top p95: qa-payara 547 ms	services above 1% errors: 2 (prev 0)	[6]
Hosts	RED	5 of 8 hosts peaked above 85% netdemo-app2: cpu 100%, memory 81%, disk 27% ktranslate-flex: cpu 100%, memory 81%, disk 89% netdemo-app1: cpu 99%, memory 85%, disk 24%	hosts above 85%: 5 (prev 1)	[7]
Synthetics	RED	overall failure 26.29% across 78 monitors Microsoft health: 100.00% failed (336 checks) again-dummy: 100.00% failed (672 checks) test-ping-wikipedia-org-privacy: 100.00% failed (672 checks)	overall failure 26.29% (prev 27.46%)	[8], [9]
Service levels	RED	8+ of 56 below 25% error budget Online Boutique Frontend - Success: 0% error budget left CC - Latency < 0.1s (Store-Checkout): 0% error budget left	no week-over-week comparison (latest snapshot only)	[10]

CC - Latency < 0.1s (Store-Checkout): 0% error budget left

2. Critical alert events

146 critical alert event(s) open now; 3960 opened this week; 23 warning open now. [1], [3]
Open since 2026-11-02 03:35 UTC (2.8 days): test-ping-reddit-com, test-ping-reddit-com query result is > 0.0 on 'Synthetics - Failed Check'
Open since 2026-11-02 03:36 UTC (2.8 days): test-ping-reddit-com-terms, test-ping-reddit-com-terms query result is > 0.0 on 'Synthetics - Failed Check'
Open since 2026-11-02 06:15 UTC (2.7 days): store-currencyservice, Signal lost for 10 minutes on 'Low Application Throughput'
Open since 2026-11-02 06:15 UTC (2.7 days): store-paymentservice, Signal lost for 10 minutes on 'Low Application Throughput'
Open since 2026-11-02 11:25 UTC (2.5 days): CC - Latency < 0.1s (Store-Checkout), CC - Latency < 0.1s (Store-Checkout) query result is < 10.0 for 20 minutes on 'CC - Latency (Error budget consumption) - Store-Checkout'
(141 more open critical alert events not listed. [4])
Alert events that opened before the 7-day window and are still open are not counted.

3. Probable causes and recommended actions (Autopilot)

Critical Alert Investigation

Synthetic Monitors & store-currencyservice — Account

Analysis Window: 2026-10-28T23:45:54 UTC – 2026-11-04T23:45:00 UTC (7 days)

Three critical alert events were investigated: two Synthetics monitor failures (`test-ping-reddit-com` and `test-ping-reddit-com-terms`) and a signal-lost / throughput-drop event on `store-currencyservice`. Both Synthetics monitors are failing at near-100% rates due to HTTP 403 responses from the target. `store-currencyservice` is effectively offline — only 16 transactions recorded in a single brief burst across the entire 7-day window, with no logs and no error groups.

Synthetics Monitor Failures

Issue Summary — Both monitors have been failing continuously for at least 14 days. Every failure returns the same error: `HTTPError: Server replied with a HTTP 403 response code`. All checks run from a single location (Washington, DC, USA).

Monitor	Failed	Succeeded	Failure Rate	Error
test-ping-reddit-com	668	4	99.4%	HTTP 403
test-ping-reddit-com-terms	669	3	99.6%	HTTP 403

- **Prior week comparison:** Both monitors had 672 failures and 0 successes in the preceding 7 days (Oct 21–28 UTC), confirming this is a persistent, pre-existing condition — not a new regression.
- **Brief success window:** Both monitors recorded their only successes on 2026-11-02 around 03:34–03:35 UTC, suggesting a momentary change in the target's response behavior.
- **Root Cause:** The target (reddit.com) is returning HTTP 403 (Forbidden) to the synthetic ping requests. This is a server-side block by the target, not a New Relic infrastructure issue. The monitors are running from only one location, so there is no geographic diversity to confirm.

store-currencyservice — Signal Loss / Throughput Drop

Issue Summary — `store-currencyservice` is nearly completely inactive. Across the 7-day window, only 16 transactions were recorded, all concentrated in a single burst on 2026-11-02 around 06:04–06:06 UTC. The last transaction was at 2026-11-02T06:06:12 UTC; the last metric was at 2026-11-02T06:04:00 UTC. Zero logs were found. Zero error groups exist.

- **Throughput anomaly:** Average throughput was 0.001 RPM with a spike to 4 RPM — flagged as a critical spike anomaly, but this reflects a near-dead service briefly coming alive, not a traffic surge
- **Golden metrics during the brief burst:** Response time avg 289 ms (p99: 762 ms), error rate 0%, CPU utilization avg 4.1%
- **Host count:** 1 host active only during the burst day; 0 hosts on all other days
- **Prior 2 weeks:** Only 40 total transactions across 14 days (21 in the week of Oct 14–21, 19 in Oct 21–28), confirming a chronic pattern of near-zero activity
- **No deployments or change events** were found for this entity in the analysis window
- **Alert conditions on policy "Golden Signals":** Low Application Throughput fired 28 incidents across 28 issues; High Latency fired 9 incidents — both consistent with the service being offline
- **Alert condition on policy "AutoPilot Example" (ID 15130464):** Targets `store-frontend` (entity GUID `NzY5NzkzMXxBUE18QVBQTElDQVRJT058NDUyMzgwNTky`), not `store-currencyservice` — this condition is unrelated to the current entity

Root Cause: Current telemetry does not identify why `store-currencyservice` is inactive. The service appears to be stopped, undeployed, or its agent is not reporting. No logs, no sustained metric flow, and no change events are available to confirm the cause.

Recommended Actions

- **Synthetics monitors:** The HTTP 403 indicates reddit.com is blocking synthetic requests. Either update the monitors to use a different endpoint that permits automated checks, add request headers (e.g., a valid User-Agent), or disable/mute these monitors to reduce alert noise — they are not monitoring your infrastructure.
- **Synthetics location diversity:** Add additional check locations beyond Washington, DC to distinguish target-side blocks from network-specific issues.
- **store-currencyservice availability:** Verify the service is deployed and running — check pod status, deployment state, and whether the New Relic agent is configured and reporting. The service has been nearly inactive for at least 14 days.
- **Throughput alert noise:** The 28 Low Application Throughput issues on `store-currencyservice` are expected given the service is offline. Consider muting these alerts until the service is restored to avoid alert fatigue.
- **Investigate the brief activity burst on Nov 2:** The 16 transactions and 39 metric data points around 06:04 UTC suggest a brief startup or health check — determine if this was a manual restart, a scheduled job, or an automated recovery attempt.

Follow-up questions:

1. Is `store-currencyservice` intentionally decommissioned or expected to be running?
2. Are the reddit.com Synthetics monitors still needed, or were they created for testing purposes?

4. Data gaps

None. Every health area returned data.
