[RED] Weekly observability report, 2026-11-05

New Relic Workflow Automation <noreply@eu-notifications.newrelic.com> Thu, Nov 5, 2026 at 5:08 PM
To: [redacted]

new relic

Hello,

Weekly observability report

Generated 2026-11-05 17:05 UTC. Overall: RED

1. Health summary

Area	Status	This week	Week over week	Source
Alert events	RED	142 critical open now, 22 warning open now	critical opened 3912 (prev 3780), warning opened 1402 (prev 2020)	[1], [2], [3], [4]
Browser	RED	2 of 2 apps above an amber threshold (p75) Perspective-Gold: CLS 0.434 Buying Program Simulator: LCP 2.06 s, INP 56 ms, CLS 0.000, JS errors 7.50% of page views	apps above amber: 2 (prev 1)	[11], [12], [15]
Mobile	NO DATA	13 mobile app(s) exist but sent no MobileSession events in the Report Window.	no data	[13], [14], [15]
APM services	RED	3 of 19 services above 1% errors Top errors: netdemo-front-apm 6.46% (66386 requests) Top p95: qa-payara 672 ms	services above 1% errors: 3 (prev 0)	[6]
Hosts	RED	5 of 8 hosts peaked above 85% netdemo-app2: cpu 100%, memory 81%, disk 27% ktranslate-flex: cpu 100%, memory 83%, disk 89%	hosts above 85%: 5 (prev 1)	[7]
Synthetics	RED	overall failure 26.25% across 78 monitors Microsoft health: 100.00% failed (336 checks) again-dummy: 100.00% failed (672 checks)	overall failure 26.25% (prev 27.38%)	[8], [9]

Service levels	RED	8+ of 56 below 25% error budget Online Boutique Frontend - Success: 0% error budget left CC - Latency < 0.1s (Store-Checkout): 0% error budget left	no week-over-week comparison (latest snapshot only)	[10]

2. Critical alert events

142 critical alert event(s) open now; 3912 opened this week; 22 warning open now. [1], [3]
Open since 2026-11-02 19:02 UTC (2.9 days): Online Boutique Frontend, Online Boutique Frontend query result is > 0.0 on 'Synthetics - Failed Check'
Open since 2026-11-02 19:05 UTC (2.9 days): Online Boutique Frontend, Online Boutique Frontend query result is >= 1.0 on 'WBA Workflowautomation Test'
Open since 2026-11-02 19:15 UTC (2.9 days): Online Boutique Frontend, Online Boutique Frontend query result is > 0.0 on 'Synthetics - Failed Check'
Open since 2026-11-02 20:42 UTC (2.8 days): Scheduled dashboard report, Scheduled dashboard report query result is >= 1.0 on 'WBA Workflowautomation Test'
Open since 2026-11-02 20:52 UTC (2.8 days): again-dummy, again-dummy query result is >= 1.0 on 'WBA Workflowautomation Test'
(137 more open critical alert events not listed. [4])
Alert events that opened before the 7-day window and are still open are not counted.

3. Probable causes and recommended actions (Autopilot)

Synthetic Monitor Alert Investigation

Online Boutique Frontend — Account

Analysis Window: 2026-10-29 17:05:34 UTC – 2026-11-05 17:05:00 UTC (~7 days)

The **Online Boutique Frontend** synthetic monitor has a **100% failure rate** — all 12,094 checks failed across the entire 7-day window with the single error `Could not connect to server`. Every check from all three locations (London, Paris, Dublin) failed consistently with zero successes. Two alert policies are actively firing: **Synthetics - Failed Check** (policy CC - Testing, condition 13950125) with 50 incidents across 50 issues, and **WBA Workflowautomation Test** (policy WBA - Worflow - Testing, condition 15746724) with 48 incidents across 48 issues. No deployments or change events were found on either the synthetic monitor or the backend `store-frontend` APM entity in the surrounding days.

Issue Summary

The monitor is a Simple Browser check (Chrome/Firefox, JAVASCRIPT) running every 5 minutes from 3 EU locations. It has been **completely unreachable** for the full 7-day window — this is not intermittent; it is a sustained outage from the monitor's perspective.

Root Cause Analysis

- **Single error across all failures:** `Could not connect to server` — 12,094 of 12,094 checks
- This indicates the monitored endpoint is unreachable from all three public locations (London, Paris, Dublin)
- The error is a connection-level failure, not an HTTP error or script assertion failure
- **All locations equally affected:**
- London, England, UK — 4,032 checks, 100% failed
- Paris, FR — 4,031 checks, 100% failed
- Dublin, IE — 4,031 checks, 100% failed
- **No change events detected** on `store-frontend` or the synthetic monitor entity in the 48 hours surrounding the window, ruling out a recent deployment as the trigger
- **Backend APM health for `store-frontend`** could not be assessed — the subagent analysis did not return structured results. The APM entity exists ( ) with alert severity NOT_CONFIGURED

Impact Assessment

- The monitor generates **continuous alert noise** — 50 + 48 = 98 incidents across two policies over 7 days
- At a 5-minute interval across 3 locations, this monitor was previously identified as consuming ~1,284 CCUs/month (from earlier sessions, not re-checked), making it the top Synthetics cost driver in this account
- Real-user impact is **unverified** — the `Could not connect to server` error confirms the monitor cannot reach the target, but whether end users are also affected requires checking the `store-frontend` APM entity's throughput and error rate directly

Recommended Actions

- **Verify the monitored URL is correct and the target is actually running** — the sustained `Could not connect to server` error across all locations for 7 days suggests the endpoint may be down, misconfigured, or the URL in the monitor script is stale. Check the monitor's configured URL and confirm the application is serving traffic
- **Check `store-frontend` APM throughput** to determine whether real users can reach the application — if APM shows healthy throughput, the issue may be network/firewall rules blocking synthetic check locations
- **Disable or mute the monitor until the target is restored** — it is generating ~98 incidents/week of pure noise with no actionable signal while the endpoint remains unreachable
- **Add a minimum duration clause** to the alert conditions to reduce flapping once the monitor is restored — both conditions fire on any single failure occurrence
- **Review TLS validation** — the monitor has `useTlsValidation: false`; if the target was moved behind TLS or its certificate changed, this setting would mask that, but the connection-level failure suggests the host/port is unreachable rather than a TLS issue

---

Follow-up questions:

1. Is the Online Boutique Frontend application intentionally decommissioned or moved to a different URL?
2. Are there firewall or network policy changes that may be blocking inbound traffic from New Relic's EU synthetic locations?

4. Data gaps

Mobile: 13 mobile app(s) exist but sent no MobileSession events in the Report Window.
